Description of GH-P type

1.Features and advantages of GH-P type Busduct

1-1. Features

(1) Insulation

Seamless coating with thickness at least 1.5 mm to prevent infiltration of water and moisture provides high quality insulation electrically and mechanically.

(2) Compact and light weight

Totally isolated and compact size of ducts enable the saving of the facility space, which can lead efficient design bearing compact and light.

(3) Low voltage drop

The voltage drop is very low because the short distance between isolated conductors causes low reactance.

(4) High short time current capacity

The mechanical strength to overcome the magnetic force between conductors allows the higher short time current capacity than that of standards, JIS and KS.

(5) Ease of installation and maintenance

Small, light and one-touch joint system enables easy installation. No bolt connection required other than the standard connection. It's also safe because all conductors are insulated.

(6) temperature rise

The temperature rise shall be made uniformly regardless of the bus duct arrangement - horizontal, vertical, flat and edgy- due to no convection inside.

(7) Safe from fire

It do not cause the fire and ensure safety in case of fire because of the structure and the insulation material that is flame-retardant.

(8) No noise

Solid structure does not make any noise that may happen by the vibration due to current flow

(9) No influence of induction

Conductors are contacted together closely with proper insulation. Thus the leakage of the magnetic flux is too small to have influence on communication system

<Fig. 1 Structure of cross section>

1-2. Advantages

(1) No holes in conductors

Joints are made without piercing holes of conductors. Clamping bolts do not run through the conductors in order to secure mechanical strength and electrical reliability.

(2) Contact area

As joints are made without piercing of conductors more contact area can be secured to recuce the resistance.

(3) Joint by leaf springs

A spring material wider than the bus bar is used in jointing so as to ensure a constant contact pressure,

which does not cause any unbalance of temperature rise and current flow.

(4) No stress concentration

Providing very high reliability electrically and mechanically because of using high strength insulation spacers and removing piercing holes in the conductors which may cause stress concentration at the jointing area.

(5) Ideal connection

To pursue the ideal connection jointing between conducts is made at the same time with that of between ducts.

(6) Ease of installation and maintenance

One-touch joint system enables easy installation. Checking the jointing area is possible without any interruption of the power.

<Fig. 2 Detial of joint part>

2. Structure of GH-P type Busduct

2-1. Conductor

(1) Copper conductor

- Cu busbar defined in KSD5530
- With purity of 99.90% and more.
- With conductivity of 98% and more.

(2) Aluminium conductor

Al busbar defined in KSD6762 -With purity of 99.60% and more. -With conductivity of 61% and more.

2-2. Insulation coating

The conductor is coated with Polyvinyl-Chloride material that is flame-retardant and have insulation class B(135°C).

2-3. Housing

The housing shall be made of galvanized sheet steel SEHC with thickness of 1.6mm defined in KSD3528 which is not apt to corrode.

3. Ratings of GH-P type Busduct

Rated voltage	AC660V, DC750V less		
Rated current	AI - Fe Type : 600A~5000A		
	Cu - Fe Type : 600A~6500A		
Rated frequency	50 / 60Hz		
System configuration	1P2W, 3P3W, 3P4W, 3P5W		
Cystem conniguration	3P5W (External Type)		
	Indoor Type : IP41 - IP42		
Degree of protection	Outdoor Type : IP55 - IP65		
	Weather - Proof : IP54		
	Altitude : Max. 1000m		
Service condition	Ambient temperature : -20°C to 40°C		
	Humidity : Max. 97%		
Applied standards	KS C8450, JIS C8364, IEC 60439-2, BS 5486		
Туре	General type, Fire resistance type		

4. Finish color

Powder coating shall be used in color MUNSELL No.5Y 7/1 or 7.5 BG 6/1.5

5. Test

5-1. Routine test

- (1) General inspection : Checking materials, structure, dimensions and assembly status
- (2) Dielectric test : Should be min. 510 when tested with DC500V Megger between phases, and live part and non-live part.

(3)Withstand voltage : Should withstand when AC 7000V is applied for 1 min. between phases, and live part and non-live metal part.

5-2. Type test

Temperature-rise, Short-circuit, Vertical loading, Holizontal loading and Impact tests, Fire resistance test.

5-3. Certification (concerning short-circuit test)

- (1) ASTA in U.K. : 800A/50kA, 1200A/60kA, 1600A/80kA
- (2) KERI in Korea : 1600A/80kA, 2500A/120kA
- (3) FILK in Korea : 1500A, 2000A (750°C at fire resistance test)
- (4) KIMM in Korea : IP65

6500	0.068	0.028	0.074	0.071	0.031	0.077

Note) R is the resistance at 95°C

4. Temperature characteristics

4-1. Temperature curve at rated current

- (1) The allowable degree is 95°C under the current.
- (2) Temperature rise is 55° C at ambient temperature 40° C

<Fig.1 Temperature checking points of the joint part>

• 3 Ø 3W 1200A (Example)

• 3 Ø 3W 2000A (Example)

4-2. Temperature rise at thermal current

Saturated temperature rise is 55°C at any rated currents.

- (1) Temperature rise at different load currents
- (2) Allowable load current to short time current before saturation
- (3) You can get the above values from below curves.

<Fig.2 Temperature rise curves at thermal current>

Example

1. Allowable temperature rise is 32 $^\circ C$ when 1650A flows in 2000 rating busduct.

2. Allowable overload current is 5300A/hr at no load status in 3500 rating busduct.

Factor for allowable current by ambient temperature

Ambient ter	nperature	Feeter	Ambient te	Faster	
°C	°F	Factor	°C	۴F	Factor
15	59	1.21	40	104	1.00
20	68	1.17	45	113	0.95
25	77	1.13	50	122	0.90
30	86	1.09	55	131	0.85
35	95	1.04	60	140	0.80

Compositions and dimensions of GH-P type busduct

1. Distribution system

• Busduct distribution system for a building

• Busduct distribution system for a factory

2. Cross section and busbar size

For indoor

• For outdoor

Note) 1. Ground Busbar (Cu : $3T \times 25mm$) is external type and optional. Fig.D 2. 5500A and 6500A are only for Cu conductor.

• For indoor

3.Compositions

4. Feeder Busduct

2. In case of ordering non-standard length user's approval is required before production.

5. Tap off Busduct

2. In case of ordering non-standard length user's approval is required before production.

3. It is applied to branch circuit rating of 500A and more (Bolt-on type)

6. Plug-in Busduct

3. Please contact if Plug-in type is required for branch circuit rating of 500A and more

7. Elbow, Tee and Offset

• Flatwise Elbow(Vertical)

Rated current	Standard length	Minimum length
(A)	$L_1 \times L_2(mm)$	L₁ × L₂(mm)
600		310×310
800		320×320
1000	400×400	335×335
1200		345×345
1350		360×360
1500		370×370
1600	500×500	375×375
2000		405×405
2500		470×470
3000	600×600	505×505
3500		560×560
4000	700×700	620×620
4500, 5500	700 × 700	635×635
5000, 6500	750×750	720×720

Note) The summation the ELBOW Length of (L1+L2) is 2500mm at maximum.

• Edgewise Elbow(Horizontal)

Rated current (A)	Standard length $L_1 \times L_2(mm)$	Minimum length $L_1 \times L_2(mm)$
600-6500	400×400	270×270

Note) The summation the ELBOW Length of (L1+L2) is 2500mm at maximum.

• Flatwise Tee Elbow

Rated current	Standard length	Minimum length
(A)	$L_1 \times L_2 \times L_3$ (mm)	$L_1 \times L_2 \times L_3$ (mm)
600		$350\times350\times350$
800	500 × 500 × 500	$360 \times 360 \times 360$
1000		$375 \times 375 \times 375$
1200		$385 \times 385 \times 385$
1350		$400 \times 400 \times 400$
1500		410×410×410
1600		$420 \times 420 \times 420$
2000		$450 \times 450 \times 450$
2500		510×510×510
3000	650×650×650	$550 \times 550 \times 550$
3500		$600 \times 600 \times 600$
4000	700700700	660×660×660
4500, 5500	$700 \times 700 \times 700$	$680\!\times\!680\!\times\!680$
5000, 6500	800×800×800	$760\!\times\!760\!\times\!760$

Note) The summation the Tee Length of $(L_1+L_2+L_3)$ is 2500mm at maximum.

• Flatwise Offset

<Fig.A>

• Edgewise Offset

<Fig.B>

	Flatwise of	offset : Fig.A	Edgewise offset : Fig.B				
Rated current(A)	Standard length	Minimum length	Standard length	Minimum length			
	$L_1 \times L_2 \times L_3(mm)$	$L_1 \times L_2 \times L_3$ (mm)	$L_1 \times L_2 \times L_3$ (mm)	$L_1 \times L_2 \times L_3(mm)$			
600		310×275×310					
800		320 × 300 × 320					
1000	$400 \times 500 \times 400$	335 × 325 × 335					
1200		345 × 350 × 345					
1350		$360 \times 375 \times 360$					
1500		370×400×370					
1600	$500 \times 500 \times 500$	375×410×375	$400 \times 400 \times 400$	$270 \times 205 \times 270$			
2000		405 × 465 × 405	400 × 400 × 400	270×205×270			
2500		470×375×470					
3000	$600 \times 600 \times 600$	505×410×505					
3500		$560 \times 465 \times 560$					
4000	700 700 700	620×400×620					
4500, 5500	700×700×700	635×410×635					
5000, 6500	750×750×750	720×465×720					

Note) The summation the Offset Length of $(L_1+L_2+L_3)$ is 2500mm at maximum.

Combination Elbow

Rated current(A)	Standard length $L_1 \times L_2 \times L_3$ (mm)	Minimum length $L_1 \times L_2 \times L_3$ (mm)
600		310×245×270
800		320×255×270
1000	$400 \times 400 \times 400$	335×270×270
1200		345 × 280 × 270
1350		360×295×270
1500		$370 \times 305 \times 270$
1600	$500 \times 500 \times 400$	375×310×270
2000		405 × 340 × 270
2500		470×405×270
3000	$600 \times 600 \times 400$	505 × 440 × 270
3500		560 × 495 × 270
4000	700 700 100	620 × 555 × 270

18. Plug-in Box(3 Ø 4W)

(1) Safety lock

Safety lock is used in the Plug-in Box except Fuse type. Door interlock : Door is locked when the breaker is closed(ON). Interlock with Busduct : Plug-in Box can not removed from Busduct when the breaker is closed(ON).

(2) Knock-out hole

Company standard knock-outs are provided.

(3) Neutral pole

The neutral pole is located on the right.

(4) Door opening direction

Right hinge type is used for the door. Left hinge type is optional.

(5) Earthing

Connect the earting support of the plug-in box with the Busduct before installing of the plug-in box.

Vertical Mounting (Example)

Busduct system design manual

1. Considerations in layout design

- The current and future loads should be condered in rated current of the busduct
- If the ambient temperature exceeds 40°C, the rated current needs to be compensated. (See the reference table)
- Voltage drop should be considered if the long busducts are used.
- Consider the mechanically thermal strength of the busduct concerning short-circuit current.
- Lower rating Busduct can be used if Reducer is properly used in the Busduct Route.
- Plug-in box is recommended for the connection of the load side and spare plug-in hole for future load should be considered.
- Straight arrangement is recommendable. Try not to use Elbow if possible.
- Install it in the place that is dry and easy for maintenance.
- Consulting with maker is recommendable for install route.
- Remember it is tough to modify and change the spec during Busduct produing and installation.

2. Reasonable distribution system design

- (1) Drawing A: Conventional design that needs complicate distribution works and is not easy to maintenance.
- (2) Drawing B: More reasonable and economical than Drawing A in distribution system and works.
- (3) Drawing C : More reasonable and economical than Drawing A and B in distribution system and works. It also provides more advantages in maintenance, increasing of branch, modifying of layout and less expenses in installation works.

3. Minimum distance between parallel-installed Busduct

Indoor type

In case bus duct joints come side by side

Rated current	'A' Dimensions (mm)		
(A)	3W	4W	
600-6500	150	160	

In case bus ducts joints deviate from each other. (In case 'C' in the following figure is above 190 mm)

Rated current	'A' Dimensions (mm)		
(A)	3W	4W	
600-6500	85	95	

Outdoor type

In case bus duct joints come side by side

In case bus ducts joints deviate from each other. (In case 'C' in the following figure is above 500 mm)

Rated current	'A' Dimensions (mm)		
(A)	3W	4W	
600-6500	150	180	

100

Minimum clearance of bus ducts installed flat in parallel.

100

4. Position of the Busduct joint point

Minimum clearance between joint point and the floor (A) and (B)

Minimum clearance between joint point and wall (A)

- Joints may not be inside walls or floors.
- Joint point must be more than 240 mm from the surface of a wall.
- If a vertical spring hanger is to be used on a floor, the distance shall be more than 450 mm, while it shall be more than 300mm if a vertical hanger is to be used.
- Floor flange and Wall flange are useful to fill the empty after installation of Busduct
- When each unit is divided from vertical Busduct, the installation of vertical Spring hanger and Fixed hanger should be condsidered.

5. Minimum clearance between bus duct and wall, floor and etc.

6. Hanger supporting

- Prepare 12mm(1/2") lifting bolts
- Make horizontal level of Busduct with the bolts
- Do not overlap the joint with the lifting bolt
- Busduct shall be fixed with Hanger
- The standard distance between supporters of Busduct shall be 1.5m. It should not be longer than 2m
- In case of more than one Busduct do not separate each Busduct and use one Hanger structure
- The supporters such as Angle and Channel should be selected according to load, supporting distance and its condition.

Standard distance between supporters

(1) Graph for W and L in case of safety factor Sf=5 $\,$

- (2) Angle and Channel are made of steel
- (3) Followings are related formulas

M : Bending moment Z : Section modules

Supporting	Maximum bending moment M			
method				
Both ends supporting	$M = \frac{WL}{4}$	$V = \frac{WL^3}{48EI}$		

Size for supporters

Note) E=Young' s Modules I=Second Moment of area

Shapes of steel

	Steel material size	Z (cm³)	l (cm³)	Weight (kg/m)
а	40×40×3	1.21	3.53	1.83
b	40×40×5	2.49	9.06	3.06
С	50×50×6	3.55	12.60	4.43
d	65×65×6	8.47	46.10	6.85

f	100×50×5	7.82	26.90	9.36
g	75×40×5	20.20	75.90	6.92
h	100×50×5	37.80	189.00	9.36

Note) Z=Section Modules

I=Second Moment of area

7. How to apply the expansion

Whether or not the expansion unit is determined according to how the bus duct is supported at the two ends of the installation route, whether the bus duct line is branched, and what length the bus duct is installed

Supporting bondition	Branching	Fig.	Length(L)
Both ends free	Branched at each story	I	≦120(m)
One end free One end fixed	Branched at each story	Ш	≦90(m)
	Not branched	=	≦30(m)
Both ends fixed	Branched at each story	IV	≦30(m)
	Not branched	V	≦15(m)

Note) Following fig. shows How to use the expansion and vertical hanger and vertical spring hanger.

Installation conditions

Basic specification :

- 1. Use the expansion in case of vertical installation deviating from the above condition.
- 2. In case of horizontal installation, if necessary, install the expansion unit with the gap between 40 and 50m, where the factors such as ambient temperature, rate of load, installation condition and whether or not elbow is used are considered.
- 3. Generally the position of expansion unit is made with the approval drawings according to the shape of the Route

8. Actual measurement of busduct

- (1) In case there is a remaining porting of actual measurement, contact us with the dimension shown in the drawing below measured.
- (2) Take into consideration the work schedule in advance since it takes a minimum of 2 weeks for the actual delivery of the busduct.
- (3) Refer to the cross section for dimension, W
- (4) The available minimum length should be considered in case of actual measurement.
- In case of straight

In case of elbow

Installation manual

This manual describes the precaution that must be followed in the handing GH-P Type Bus Duct. Be sure to read it though before the work.

1. General Common Precautions

1-1. Storage

- 1) When the bus duct arrives at the site, check the type and quantity of the main unit parts against the shipment list. See if any of them were damaged during the transpotation
- 2) Keep the bus duct at a place, dry and free from moisture and water where there is no fear of being soiled or damaged. If necessary, cover the duct with water proof sheets.
- 3) Do not lay the bus duct directly on the ground. Always place pieces of wood under the bus duct and stack up firmly as shown. Never put it upright in storage or during installation.

1-2. Preparation

- 1) Thoroughly check the bus duct laying route to see if there are any obstacles, eat source, water leakage, etc. Check also the dimensions of arrangement and buildings and equipment beforehand.
- 2) Check both the straight and curved routes of transportation from the place of storage to the laying site.
- 3) Install the hanging bolts or trestles for hangers beforehand. set the hanger pitch to support two places with one unit as a standard.
- 4) Investigate the site conditions in advance and determine the most advantageous laying order. The work usually start from connecting the bus duct to the transformer or the switchboard, but in case this impossible to determine precisely the positions of elbows T-branch, and then start construction, and other items which serve as the points of bus duct installation.

1-3. Laying

- 1) Use sufficiently strong materials and equipment for transportation and lifting. The weight per 1m of GH-P type bus duct is given in the catalogues. However, the special bus duct with box sometimes weight 2-3 times more than those shown in this table.
- 2) When hanging the bus duct with a rope, insert thick pieces of rag or corrugated card between them to prevent the bus duct from being damaged. When handing a copper conductor bus duct of over 2500A, use a piece of strong wood where the rope is applied so as to prevent the housing from being deformed.
- 3) Before jointing bus duct, examine whether the conductor contact surface or insulating materials are damaged. Also check that they are not soiled with dust, dirt and other foreign matter: otherwise, clean them thoroughly.
- 4) First, make loose joints of bus ducts over the whole run. After measuring the dimension, proceed the normal jointing. GH-P type bus duct allows dimensional adjustment of approx. ±3mm, at a join.
- 5) In case a megger value is found abnormal after jointing of the whole route, much time is spend to detect faulty parts. It is therefore recommended that the megger checking be partially conducted even during the jointing work.
- 6) When the work suspended during the construction, the ends of the connecting section shall be protected against water and dust.
- 7) Take care not to use the installed bus duct as scaffold or material yard.

2. Jointing procedur

• joint GH-P type bus ducts, as follows:

1) Confirm the male-female condition of two bus ducts to connected by arranging them face to face.

Be sure to check the directions of the male and female ends of the bus duct jointing section, as shown in route drawing it is described.

- 2) Remove the leaf springs temporarily fixed with bolts, and insert them until the bolt holes of both bus ducts almost conform with each other.
- Fasten the bus duct with bolts, nuts and washers by soldering both sides of the jointing section between leaf springs.

4) Tightly fasten until the leaf springs become almost flat. Do not tighten only one of the bolt first and then the other. tighten the two bolts alternately. Any type of spanner may be used.

Do not fail to place the washers to the nut side with the groove for rotating stop set to the head side of the bolt.

5) Set the joint cover after ascertaining that there is no foreign matter or abormality inside the joint section. when the jointing bolts are not tightened sufficiently, the nuts (bolts) touches the joint cover and fitting will be impossible. in this case, tighten the nuts again.

6) A completed joint is illustrated below.

3. connection with equipment

Take care of the following points when jointing the bus duct with the transformer and switchboarde

1) Apply the undermentioned value as yardsticks for the clamping torque of the conductor clamping bolt.

		(kg • cm)
Bolt size	Clamping torque	
M8	120-150	
M10	240-500	
M12	420-1020	
M16	1050-1300	

2) Do not fail to face the blue surface of the Belleville washer (cup washer) towards the inner side (conductor side).

4. Vertical fixed(spring) hanger

Take care of the following points when fixing the hanger at the time of laying of the bus duct vertically

- 1) First install the fixed hanger (the position is described in the route drawing) as illustrated in the drawing below and fix the bus duct tightly.
- After determining the position with fixed hanger installed, connect the bus ducts in sequence and install the spring hangers to each floor.
- 3) Install the spring hanger in accordance with the description below.

5. Earthing of housing

At the connection section of mutual bus ducts, the continuity of the earth is secured automatically by fixing the joint cover. Further, with the equipment is performed by flange connection, it will be electrically connected with the toothed lock washer attached to the bolt for the flange biting into the flange of the equipment and the bus duct when the bolt is clamped. in case the terminal is not flange connection, set the earth by connection the IV line to the stud fitted to the terminal section.

6. Actual measurement bus duct

In case there is a remaining porting of actual measurement, contact us with the dimension shown in the drawing below measured.

take into consideration the work schedule in advance since it takes a minimum of 2 weeks for the actual delivery of the bus duct.

7. Test and checking after the laying

When the laying of the bus duct is completed, check the whole route, mainly the points described below at the same time with the measurement of insulation resistance of the whole structure being carried out. When carrying out the measurement of the insula-tions resistance, disconnect the equipment connected and, further when plug-in breaker is installed conduct the measurement after setting the breaker OFF. The insulation resistance value cannot be specified due to the difference of the length of the route and the environmental conditions, but if it is a dried atmosphere normally it would be a value of some 100 M_{\odot} (500V megger). In case it is below 5 M_{\odot} , it has to be checked as it is most likely that there, may exist some factors which may reduce the insulation. (The confirmation is easy if intermediate checking of Paragraph 1-3 (5) could be conducted).

- 1) Whether the bus duct is not damaged,
- 2) Whether the connecting parts are fixed precisely,
- 3) whether the bolts for connecting the equipment are securely fastened,
- 4) whether the hangers are supporting the bus duct securely.

8. Plug-in box installation sequence

- 1) Check the drawing to locate where to install boxes.
- 2) Remove the cover of each plug-in hole.
- Using the earth jaw of he box as a guide, insert a clip.

4) Open the top cover of the box. Use a screw driver to turn the duct fixing screws in the box to firmly fix the box to the duct.

5) Completion

9. Maintenance and checking

The following maintenance and checking are both recommended for guaranteeing safe usage of the bus duct for a long time.

(1) Check the external appearance

Checking to see whether there is deformation, damage, dirt, etc. throughout the whole length of the bus duct and whether there is dislocation, bending and other abnormality of the connecting covers, hanger and plug-in appliances.

(2) environmental check

The environment where the bus duct is used sometimes changes after its installation. Check whether the environment has become hazardous even partially due to water, moisture, high temperature, corrosive gas, immoderate vibration, duct etc. (There will be no problem with the bus duct where countermeasures are taken from the initial stage.)

(3) check the connection section

There will be no problem of loosening of the connection section of GH-P type bus-duct by "concordance" as leaf springs of high deflection are employed for the connection section. Therefore, periodical increased clamping is unnecessary. However, when the contact surface is soiled or deteriorated during the construction or during the storage, a simple check by touching the external portion during the current sending is recommended as the above effects would gradually arise. (If the temperature of the connection section and the main body is about the same, there will be no problem.)

(4) Check the load condition

After the construction of the plug in bus duct. increase of load is expected at the early stage. carry out checking whether the total of load is not exceeding the capacity of the bus duct at the time the load is increased. Especially, pay attention when the main line is branched by T-branch or cross.

Conduct the above mentioned check about a year excluding Paragraph (4).

When clamping is insufficient, the nut will become a stopper and the connecting cover will not be able to be fitted.

When clamping is adequate, the connecting cover will fit

Merits

1. Operation is simple.

Clamping is only required until the spring becomes flat and special tools such as torque-wrench are wholly unnecessary.

2. Operation id safe

There is absolutely no shock at the time of cutting such as torque bolts, and operation at elevated spot is also safe.

3. Reliability is great

As regards the conventional torque management, it is difficult to obtain constant clamping force due to dispersion of the coefficient of fiction.

Green Innovators of Innovation

- · For your safety, please read user's manual thoroughly before operating.
- · Contact the nearest authorized service facility for examination, repair, or adjustment.
- · Please contact a qualified service technician when you need maintenance. Do not disassemble or repair by yourself!
- Any maintenance and inspection shall be performed by the personnel having expertise concerned.
